3 Introduction

The following document details the Module Interface Specifications for 2D Localizer, a program that implements various sensors to help localize mobile robots on a 2D plane in enclosed environments.

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at <https://github.com/AliyahJimoh/2D-Localizer>.

4 Notation

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003). The mathematical notation comes from Chapter 3 of Hoffman and Strooper (1995). For instance, the symbol $:=$ is used for a multiple assignment statement and conditional rules follow the form $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$.

The following table summarizes the primitive data types used by 2D Localizer.

Data Type	Notation	Description
character	char	a single symbol or digit
factor	Factor	a constraint in a factor graph that relates variables
factor graph	Graph	a collection of factors defining an optimization problem
integer	\mathbb{Z}	a number without a fractional component in $(-\infty, \infty)$
natural number	\mathbb{N}	a number without a fractional component in $[1, \infty)$
noise Model	Model	a model that defines uncertainty in a measurement
real	\mathbb{R}	any number in $(-\infty, \infty)$
string	String	more than one symbol put together
values	Values	a container that stores variable estimates in a factor graph

The specification of 2D Localizer uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, 2D Localizer uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

2D Localizer also uses data types from the Georgia Tech Smoothing and Mapping (GTSAM) library which is used for solving estimation problems using factor graphs. Factor graphs are a way to represent relationships between variables using "factors" (pieces of information gotten from sensors or motion)

5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2
Hardware-Hiding Module	
	GTSAM Module
	Input Format Module
	Output Module
Behaviour-Hiding Module	Localization Module
	Control Module
	Accuracy Evaluation Module
Software Decision Module	Plotting Module

Table 1: Module Hierarchy

6 MIS of Control Module

6.1 Module

main

6.2 Uses

- Input Format Module (Section 8)
- Localization Module (Section 9)
- Accuracy Evaluation Module (Section 10)
- Plotting Module (Section 12)
- Output Module (Section 11)

6.2.1 Exported Constants

None

6.2.2 Exported Access Programs

Name	In	Out	Exceptions
main	-	-	-

6.3 Semantics

6.3.1 State Variables

None

6.3.2 Environment Variables

- date_queue: A queue storing tuples of estimated pose data (time, x, y, theta).

6.3.3 Assumptions

None

6.3.4 Access Routine Semantics

main():

- transition: Modifying data_queue with each iteration of range measurements as the Plotting and Output modules get updated

Get Data

input = InputData()

Start the Output Data

data_queue = Queue()

process = Process(target=run_gui, args=(data_queue,))

process.start()

m = np.size($\tilde{\mathbf{D}}$, 0)

Getting estimated pose for each set of measurements

for t in range(1,m):

$\hat{\mathbf{x}} := \text{localize}(\mathbf{a}, T_{mf}, T_{rf}, \tilde{\mathbf{D}}[t, :])$

Computing FIM & CRLB

fim = compute_fim($\hat{\mathbf{x}}$, \mathbf{a} , variances($\boldsymbol{\sigma}^2$))

crlb = compute_crlb(fim) *# Will be printed*

update_trajectory($\hat{\mathbf{x}}$)

data_queue.put((t, $\hat{\mathbf{x}}.x()$, $\hat{\mathbf{x}}.y()$, $\hat{\mathbf{x}}.theta()$))

Plot on the map

plot_localization_live(\mathbf{a} , T_{mf} , map)

7 MIS of GTSAM Module

7.1 Module

gtsam_wrapper

7.2 Uses

None

7.3 Syntax

7.3.1 Exported Constants

None

7.3.2 Exported Access Programs

Name	In	Out	Exceptions
Pose2	$x : \mathbb{R}, y : \mathbb{R}, \theta : \mathbb{R}$	\mathbb{R}^3	-
Point2	$x : \mathbb{R}, y : \mathbb{R}$	\mathbb{R}^2	-
symbol	char: char, int: \mathbb{Z}	String	-
NonlinearFactorGraph	-	Graph	-
PriorFactorPose2	$key : \mathbb{Z}, \mathbf{pose} : \mathbb{R}^3, noise : Model$	Factor	-
PriorFactorPoint2	$key : \mathbb{Z}, \mathbf{pose} : \mathbb{R}^2, noise : Model$	Factor	-
RangeFactor2D	$key1 : \mathbb{Z}, key2 : \mathbb{Z}, d : \mathbb{R}, noise : Model$	Factor	-
noiseModel.Isotropic.Sigma	$dim : \mathbb{Z}, \sigma : \mathbb{R}$	Model	-
LevenbergMarquardtOptimizer	$graph : Graph, values : Values$	Values	-
Values	-	Values	-
insert	$values : Values, key : \mathbb{Z}, value : Pose2 \text{ or } Point2$	-	-
atPose2	$result : Values, key : \mathbb{Z}$	\mathbb{R}^3	-
compose	$T_{mf} : \mathbb{R}^3, T_{rf} : \mathbb{R}^3$	\mathbb{R}^3	-
inverse	$T_{rf} : \mathbb{R}^3$	\mathbb{R}^3	-

7.4 Semantics

7.4.1 State Variables

None

7.4.2 Environment Variables

None

7.4.3 Assumptions

None

7.4.4 Access Routine Semantics

Pose2(x, y, θ):

- output: $out := [x, y, \theta]$ (A 2D pose with orientation)
- exception: None

Point2(x, y):

- output: $out := [x, y]$ (2D position)
- exception: None

symbol($char, int$):

- output: $out := x1(pose), a1, a2, a3(beacons)$
- exception: None

NonlinearFactorGraph():

- output: $out :=$ An empty factor graph
- exception: None

PriorFactorPose2($key, pose, noise_model$):

- output: $out :=$ Factor (A prior factor on a 2D pose)
- exception: None

PriorFactorPoint2($key, point, noise_model$):

- output: $out :=$ Factor (A prior factor on a 2D point)
- exception: None

RangeFactor2D($key_1, key_2, measured, noise_model$):

- output: $out :=$ Factor (A range factor between two keys)
- exception: None

noiseModel_Isotropic_Sigma(dim, σ):

- output: $out := \text{Model}$ (An isotropic noise model)
- exception: None

LevenbergMarquardtOptimizer($graph, values$):

- output: $out := \text{Values}$ (Optimized results from factor graph)
- exception: None

Values():

- output: $out := \text{Values}$ (An empty values container)
- exception: None

insert($Values, key, value$):

- transition: Adds point/pose into a Values variable according to its id (key)
- exception: None

atPose2($result, key$):

- output: $out := \hat{\mathbf{x}}$
- exception: None

compose(T_{mf}, T_{rf}):

- output: $out := T_{mr}$ (The composition of two poses)
- exception: None

inverse(T_{rf}):

- output: $out := T_{fr}$
- exception: None

8 MIS of Input Format Module

8.1 Module

input_format

8.2 Uses

- GTSAM Module (Section 7)

8.3 Syntax

8.3.1 Exported Constants

None

8.3.2 Exported Access Programs

Name	In	Out	Exceptions
load_input	self	-	FileNotFoundError, ValueError
get_beacons	self	$\mathbb{R}^{N \times 2}$	-
get_fmMap	self	\mathbb{R}^3	-
get_fmRobots	self	\mathbb{R}^3	-
get_map	self	String	-
get_ranges	self	\mathbb{R}^N	-
get_variances	self	\mathbb{R}^N	-

8.4 Semantics

8.4.1 State Variables

- input_file: A string representing the path to the user input file (user_input.yaml).
- data: A dictionary storing parsed YAML input data.

8.4.2 Environment Variables

None

8.4.3 Assumptions

- The module will call on a pre-existing YAML file

8.4.4 Access Routine Semantics

`load_input()`:

- transition: Reads the YAML input file and stores it in ‘self.data’.
- exception: `FileNotFoundError` if the input file is not detected and `ValueError` if the YAML file is formatted incorrectly

`input.get_beacons()`:

- output: $out := \mathbf{a}$
- exception: None

`get_fmMap()`:

- output: $out := T_{mf} = Pose2(\mathbb{R}^3)$
- exception: None

`get_fmRobot()`:

- output: $out := T_{rf} = Pose2(\mathbb{R}^3)$
- exception: None

`get_map()`:

- output: $out :=$ String of picture’s name
- exception: None

`get_ranges()`:

- output: $out := \tilde{\mathbf{D}}$
- exception: None

`get_variances()`:

- output: $out := \sigma^2$
- exception: None

9 MIS of Localization Module

9.1 Module

localization

9.2 Uses

- GTSAM Module (Section 7)
- Input Format Module (Section 8)

9.3 Syntax

9.3.1 Exported Constants

None

9.3.2 Exported Access Programs

Name	In	Out	Exceptions
localize	$\mathbf{a} : \mathbb{R}^{N \times 2}, \mathbf{T}_{mf} : \mathbb{R}^3, \mathbf{T}_{rf} : \mathbb{R}^3, \tilde{\mathbf{d}} : \mathbb{R}^N$	\mathbb{R}^3	-

9.4 Semantics

9.4.1 State Variables

None

9.4.2 Environment Variables

None

9.4.3 Assumptions

- GTSAM is installed

9.4.4 Access Routine Semantics

localize($\mathbf{a}, \mathbf{T}_{mf}, \mathbf{T}_{rf}, \tilde{\mathbf{d}}$):

- output: $out := \hat{\mathbf{x}}$
- exception: None

10 MIS of Accuracy Evaluation Module

10.1 Module

accuracy

10.2 Uses

- Localization Module (Section 9)

10.3 Syntax

10.3.1 Exported Constants

None

10.3.2 Exported Access Programs

Name	In	Out	Exceptions
compute_fim	$\hat{\mathbf{x}} : \mathbb{R}^3, \mathbf{a} : \mathbb{R}^{N \times 2}, \boldsymbol{\sigma}^2 : \mathbb{R}^N$	$\mathbb{R}^{2 \times 2}$	-
compute_crlb	$\mathcal{I}(\hat{\mathbf{x}}) : \mathbb{R}^{2 \times 2}$	$\mathbb{R}^{2 \times 2}$	-

10.4 Semantics

10.4.1 State Variables

None

10.4.2 Environment Variables

None

10.4.3 Assumptions

- Noise variances are positive

10.4.4 Access Routine Semantics

compute_fim($\hat{\mathbf{x}}, \mathbf{a}, \boldsymbol{\sigma}^2$):

- output: $out := \mathcal{I}(\hat{\mathbf{x}})$ where $\mathcal{I}(\hat{\mathbf{x}})$ is a 2×2 Fisher Information Matrix (FIM) of the estimated pose, computed as:

$$\mathcal{I}(\hat{\mathbf{x}}) = \sum_{j=1}^N \frac{1}{\sigma_j^2} \frac{(\hat{\mathbf{x}} - \mathbf{a}_j)(\hat{\mathbf{x}} - \mathbf{a}_j)^T}{\|\hat{\mathbf{x}} - \mathbf{a}_j\|^2}$$

- exception: None

compute_crlb($\mathcal{I}(\hat{\mathbf{x}})$):

- output: *out* := A 2×2 CRLB matrix, computed as:

$$\mathcal{C} = \mathcal{I}^{-1}$$

- exception: None

11 MIS of Output Module

11.1 Module

output

11.2 Uses

- Localization Module (Section 9)

11.3 Syntax

11.3.1 Exported Constants

None

11.3.2 Exported Access Programs

Name	In	Out	Exceptions
update_table	-	-	-
run_gui	queue: Queue	-	-

11.4 Semantics

11.4.1 State Variables

None

11.4.2 Environment Variables

- date_queue: A queue storing tuples of estimated pose data (time, x, y, theta).

11.4.3 Assumptions

- The function ‘run_gui()’ is executed in a separate process to prevent a stalled execution.

11.4.4 Access Routine Semantics

update_table():

- transition: Retrieves the latest pose estimates from the queue and updates the Graphical User Interface (GUI) table.

run_gui(queue):

- transition: Initializes and runs the Tkinter GUI while continuously checking for pose updates.

12 MIS of Plotting Module

12.1 Module

plot

12.2 Uses

- Localization Module (Section 9)

12.3 Syntax

12.3.1 Exported Constants

None

12.3.2 Exported Access Programs

Name	In	Out	Exceptions
plot_localization_live	$\mathbf{a} : R^{N \times 2}, \mathbf{T}_{mf} : R^3$, map: String	-	-
update_trajectory	$\hat{\mathbf{x}} : R^3$	-	-

12.4 Semantics

12.4.1 State Variables

- trajectory: A list storing estimated positions over time as (x, y, θ) .

12.4.2 Environment Variables

None

12.4.3 Assumptions

- ‘plot_localization_live()’ is run in an interactive Matplotlib session.
- ‘update_trajectory()’ is only called when valid estimated poses exist.

12.4.4 Access Routine Semantics

plot_localization_live($\mathbf{a}, \mathbf{T}_{mf}$, map):

- transition: Initializes and continuously updates a real-time localization plot.

update_trajectory($\hat{\mathbf{x}}$):

- transition: Adds the latest estimated pose to the trajectory list for the map.

12.4.5 Local Functions

update(frame):

- transition: Retrieves the latest estimated pose from the trajectory and updates the visualization.
